VoIP Firewall

An absolute must for every business and home office VoIP user

In today's modern telecommunications world, using VoIP (voice over internet protocol) trunks to connect the office telephone system to the outside world is clearly the technology of choice. VoIP offers many advantages, the greatest of these being reduced cost – something that every business is focused on in these challenging times.

However, this advanced technology comes with increased risks on the security side. We've all heard the stories that make headlines on a regular basis:

"Small company hit with \$250k long distance bill"

"VoIP telephone system hacking up by 500%"

"2,500 bogus long distance calls made in one night from off-shore through XYZ Corporation's VoIP telephone system"

The fact of the matter is that the improved technology of VoIP actually makes the process of hacking into business telephone systems easier, quicker and more successful. Thousands of access attempts can now be accomplished in seconds rather than hours. There are even specialized software programs developed to perform hacking commonly available to be downloaded from the internet.

If this has not happened to you yet, it probably will. And, VoIP service suppliers are less and less willing to forgive these large bills.

There are traditional solutions, available today, that offer protection against this form of abuse. However, they are: 1) very expensive, 2) require extensive time and expertise to install, configure and maintain, and 3) in many cases, easily identified and bypassed by smart, experienced hackers.

PIKA'S μWARP VoIP Firewall is the answer

Using a revolutionary, patent-pending process, it identifies and prevents the most common fraudulent activities BEFORE THEY HAPPEN:

- Identifies network SIP packets and performs a "deep inspection" of packets
- Identifies and stops unordinary usage based on pre-determined parameters
- Controls hacking access through voicemail, auto attendant, DISA
- Prevents internal denial-of-service caused by heavy attack attempts

- Prevents continuous attempts by dropping malicious packets rather than returning an “unsuccessful” message
- Prevents attacks in progress, rather than identifying attacks that have already occurred

The device is easily installed at your location

- Requires ZERO special skills, ZERO configuration and ZERO ongoing maintenance
- Easily plugs in right in front of your existing telephone system
- Powered by USB power supply
- Does not require an IP address (operates at layer 2), making it “invisible”/stealth and virtually impossible to detect and interact with
- Small footprint - measures just 3.75” long
- Automatically installs new updates when available
- Uses a network processor to process packets at close to wire speed

It even lets you know what it’s doing through a tri-color LED system

- Green: indicates normal operation – identifying and inspecting VoIP packets
- Yellow: indicates that attacks have been stopped in the last 24 hours
- Red: indicates that an attack is currently being stopped

**The PIKA μWARP VoIP Firewall
You can’t afford to call without it**

About PIKA Technologies

Since 1987, PIKA Technologies has pioneered technology and products that enable global telephony, fax and communications solutions. PIKA’s offerings include telephony appliances, board-level TDM products, mobile PBX, media gateways, end-user applications, smartphone apps and custom telecom development services. Known for exceptional voice quality, reliability and renowned customer service, PIKA enables developers, system integrators and businesses worldwide to take full advantage of advanced communication solutions.

This includes products that support innovation in legacy and emerging telephony models, as well as solutions that bridge the path from TDM to VoIP and services in the cloud.

With customers in more than 35 countries and numerous product and technology awards to its name, PIKA has ranked in the Branham300 – an authoritative ranking of successful Canadian high-tech firms – for 11 consecutive years.
